

AI-Based Fake Internship Detector

NLP + Risk Scoring | Base44 AI Web Application

Verify Before You Apply.

Project Details

Name: S. PRIYADARSHINI

Course: B.Tech – Computer Science and Engineering (AI & ML)

Project Type: Mini Project

Project Title: AI-Based Fake Internship Detector

Development Platform: Base44 AI

Project Link: <https://intern-shield-verify.base44.app>

1. Project Overview

The **AI-Based Fake Internship Detector** is a web application designed to help students identify potentially suspicious internship opportunities.

Students frequently find internship advertisements through social media, messaging platforms, job portals, and websites. Some opportunities may contain warning signs such as unrealistic salary promises, registration fees, vague job descriptions, suspicious communication, or requests for sensitive information.

This project analyzes internship information and provides an understandable **risk score**, identifies potential **red flags**, and gives recommendations for safer verification.

The application is built using **Base44 AI**, enabling rapid development of the web application, database functionality, authentication, and interactive user interface.

2. Problem Statement

Students searching for internships may encounter misleading or potentially fraudulent internship advertisements.

It can be difficult for students to determine whether an internship opportunity is trustworthy because:

- Company information may be incomplete.
- Unrealistic stipend or salary promises may be advertised.
- Some opportunities may request upfront payments.
- Job descriptions may be vague.
- Recruiter information may be difficult to verify.
- Suspicious application links may be provided.
- Students may not know how to identify common warning signs.

Therefore, there is a need for a simple web-based system that can analyze internship information and provide students with an understandable risk assessment.

3. Proposed Solution

The proposed system, **InternShield AI**, allows users to enter internship information such as:

- Internship title
- Company name
- Internship description
- Website
- Application URL
- Contact email
- Stipend

- Location
- Work mode
- Registration/application fee

The system analyzes the submitted information and identifies potentially suspicious indicators.

It then generates:

- Risk Score
- Risk Level
- Red Flags
- Positive Signals
- NLP Insights
- Verification Checklist
- Safety Recommendations

The system does not claim that an internship is definitely fake. Instead, it provides a **risk assessment** and encourages users to independently verify the organization.

4. AI/NLP Concept

The application uses NLP-style text analysis and risk-based scoring.

The internship description can be analyzed for indicators such as:

- Unrealistic salary promises
- Guaranteed job claims
- Registration fees
- Upfront payment requests
- Urgency or pressure language
- Suspicious phrases
- Vague job responsibilities
- Missing company information
- Unprofessional language
- Suspicious communication channels

The identified indicators contribute to the overall risk score.

5. Risk Scoring

The system uses a **0–100 risk score**.

Score	Risk Level	Meaning
0–25	 Low Risk	Few suspicious indicators detected
26–50	 Moderate Risk	Some warning signs detected
51–75	 High Risk	Several suspicious indicators detected
76–100	 Very High Risk	Multiple strong warning signs detected

The score is intended as an automated assessment and should not be treated as definitive proof that an internship is fraudulent.

6. Key Features

Internship Analysis

Users can enter or paste complete internship details for analysis.

Risk Score

The system generates a risk score between 0 and 100.

Red Flag Detection

Potential warning signs are displayed with explanations and severity levels.

NLP Insights

The application identifies suspicious keywords and phrases from the internship description.

Verification Checklist

Users receive practical steps for independently verifying an opportunity.

AI Recommendations

The system provides an understandable recommendation based on detected indicators.

Dashboard

Users can view analysis statistics and previous internship assessments.

Analysis History

Previous analyses can be stored and reviewed.

Demo Mode

Sample internship data can be used to demonstrate the complete workflow.

Responsive Design

The application is designed to work across desktop, laptop, tablet, and mobile screens.

7. System Workflow

User

Enter Internship Details

Submit Internship Description

8. Main Application Modules

1. Home Page

Introduces InternShield AI and provides access to the internship analyzer.

2. Internship Analyzer

Allows users to enter internship information.

3. AI Analysis

Processes the provided internship information.

4. Risk Assessment

Displays the calculated risk score and risk level.

5. Red Flag Analysis

Shows suspicious indicators detected during analysis.

6. NLP Insights

Displays keywords, phrases, and other text-based indicators.

7. Verification Checklist

Provides steps users can follow before applying.

8. User Dashboard

Displays analysis statistics and history.

9. Admin Dashboard

Provides overall statistics and risk analysis information.

9. Technologies Used

Technology	Purpose
Base44 AI	Application development platform
AI/NLP	Internship text analysis
Risk Scoring	Suspicion/risk assessment
Database	Store user and analysis information
Authentication	User login and account management
HTML/CSS/JavaScript concepts	Web application interface
Responsive UI	Multi-device accessibility

10. Database Structure

Users

User

- |— ID

- |— Explanation

└─ Score

11. User Interface

The application uses a modern AI/cybersecurity-inspired design.

Design Features

- Clean dashboard
- Modern cards
- Risk indicators
- Circular score visualization
- Responsive layout
- Interactive buttons
- Progress indicators
- Warning badges
- Professional typography
- Mobile-friendly interface

12. Example Analysis

Example Internship

Internship: AI/ML Intern

Stipend: ₹50,000/month

Registration Fee: ₹2,999

Description: Limited seats! Guaranteed job after internship!

Detected Indicators

- ▶ Registration fee requested
- ▶ Unrealistic stipend
- ▶ Guaranteed job claim
- ▶ Urgency language

Example Result

Risk Score: 82 / 100

Risk Level: VERY HIGH RISK

Recommendation:

Exercise strong caution. Verify the organization, recruiter and internship details independently before sharing information or making any payment.

13. Advantages

- Helps students recognize common internship warning signs.
- Provides an easy-to-understand risk assessment.
- Reduces the possibility of blindly trusting suspicious advertisements.
- Saves time during initial screening.
- Provides educational information about internship verification.
- Demonstrates practical application of AI/NLP concepts.
- Can be extended into a larger AI/ML project.

14. Limitations

- The risk score is not a guarantee that an internship is genuine or fraudulent.
- Text analysis may produce false positives or false negatives.
- External company verification may require additional trusted data sources.
- The quality of the assessment depends on the information provided by the user.
- A suspicious-looking opportunity should always be independently verified.

15. Future Scope

The project can be enhanced with:

1. Machine Learning Classification

- a. Train a model using genuine and fraudulent internship datasets.

2. URL Reputation Analysis

- a. Analyze suspicious application URLs.

3. Company Verification

- a. Integrate trusted company information sources.

4. Email Analysis

- a. Analyze internship invitation emails.

5. Browser Extension

- a. Detect suspicious internship advertisements while browsing.

6. Multilingual NLP

- a. Support English, Telugu, Hindi and other languages.

7. Real-Time Monitoring

- a. Monitor internship platforms for suspicious patterns.

8. Mobile Application

- a. Develop Android/iOS versions.

9. Advanced NLP

- a. Use transformer-based models for improved text classification.

10. Explainable AI

- Provide clearer explanations for why a particular risk score was generated.

16. Learning Outcomes

Through this project, the following concepts were explored:

- Artificial Intelligence
- Natural Language Processing
- Text analysis
- Risk scoring
- Web application development
- Database concepts
- User authentication
- Dashboard development
- Responsive UI design
- AI-assisted application development
- Problem-solving and system design

B.Tech – Computer Science and Engineering (AI & ML)

Project: AI-Based Fake Internship Detector

Platform: Base44 AI

19. Disclaimer

This project is developed for **educational and academic purposes**.

InternShield AI provides an automated risk assessment based on the information submitted by the user. It does not guarantee that an internship is genuine or fraudulent.

Users should independently verify organizations, recruiters, websites, and internship offers through trusted official sources before applying, sharing sensitive information, or making payments.

20. Conclusion

The **AI-Based Fake Internship Detector** provides a practical solution to help students evaluate internship opportunities more carefully.

By combining **NLP-based analysis, risk scoring, red-flag detection, and verification guidance**, the system demonstrates how AI can be applied to a real-world student safety problem.

The project also provides a strong foundation for future development using advanced machine learning models, external verification APIs, browser extensions, and multilingual NLP.
